Employee Management System Documentation

Requirements: Python V 3.11.5

Library: PyMongo 4.6.0

Database: Mongo-Database (MongoDB Compass)

1. Introduction

The Employee Management System is a Python-based application that allows users to input and manage employee information, storing the data in a MongoDB database. This system facilitates the creation of employee records, including details such as employee number, name, organization, job role, hiring date, department number, and salary.

2. Project Components

2.1 MongoDB Database

The project utilizes a MongoDB database to store employee information. The connection to the MongoDB server is established using the pymongo library.

2.2 Employee Class

The Employees class represents individual employees within the system. Each employee has a name and a list of relationships, allowing for future expansion to include relationships between employees.

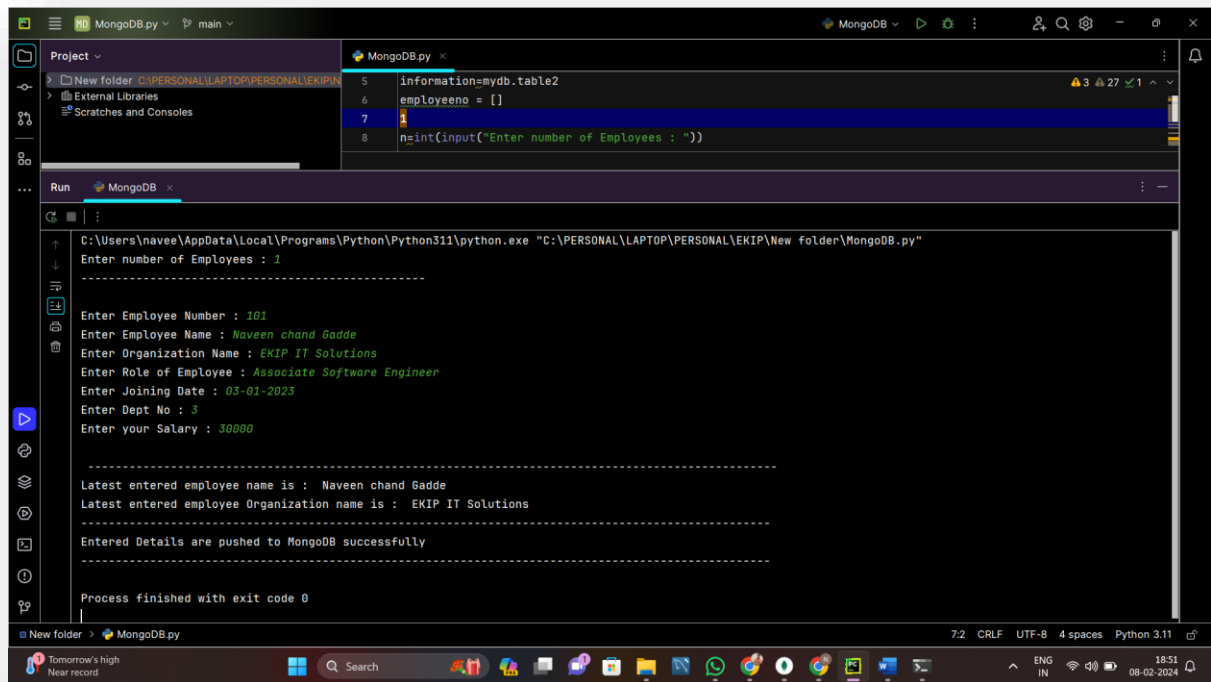

2.3 Organization Class

The Organization class represents the organization to which employees belong. Each organization has a name attribute.

3. Usage

3.1 Input Employee Information

Users can input employee information, including the number of employees (n), employee name, organization name, job role, hiring date, department number, and salary. This information is then inserted into the MongoDB database.

```
Project > MongoDB.py > main >
New folder C:\PERSONAL\LAPTOP\PERSONAL\EKIP\
External Libraries
Scratches and Consoles

MongoDB.py x
5 information=mydb.table2
6 employeeena = []
7
8 n=int(input("Enter number of Employees : "))

Run MongoDB x
C:\Users\Navee\AppData\Local\Programs\Python\Python311\python.exe "C:\PERSONAL\LAPTOP\PERSONAL\EKIP\New folder\MongoDB.py"
Enter number of Employees : 1
-----
Enter Employee Number : 101
Enter Employee Name : Naveen chand Gadde
Enter Organization Name : EKIP IT Solutions
Enter Role of Employee : Associate Software Engineer
Enter Joining Date : 03-01-2023
Enter Dept No : 3
Enter your Salary : 30000

-----
Latest entered employee name is : Naveen chand Gadde
Latest entered employee Organization name is : EKIP IT Solutions

Entered Details are pushed to MongoDB successfully

-----
Process finished with exit code 0

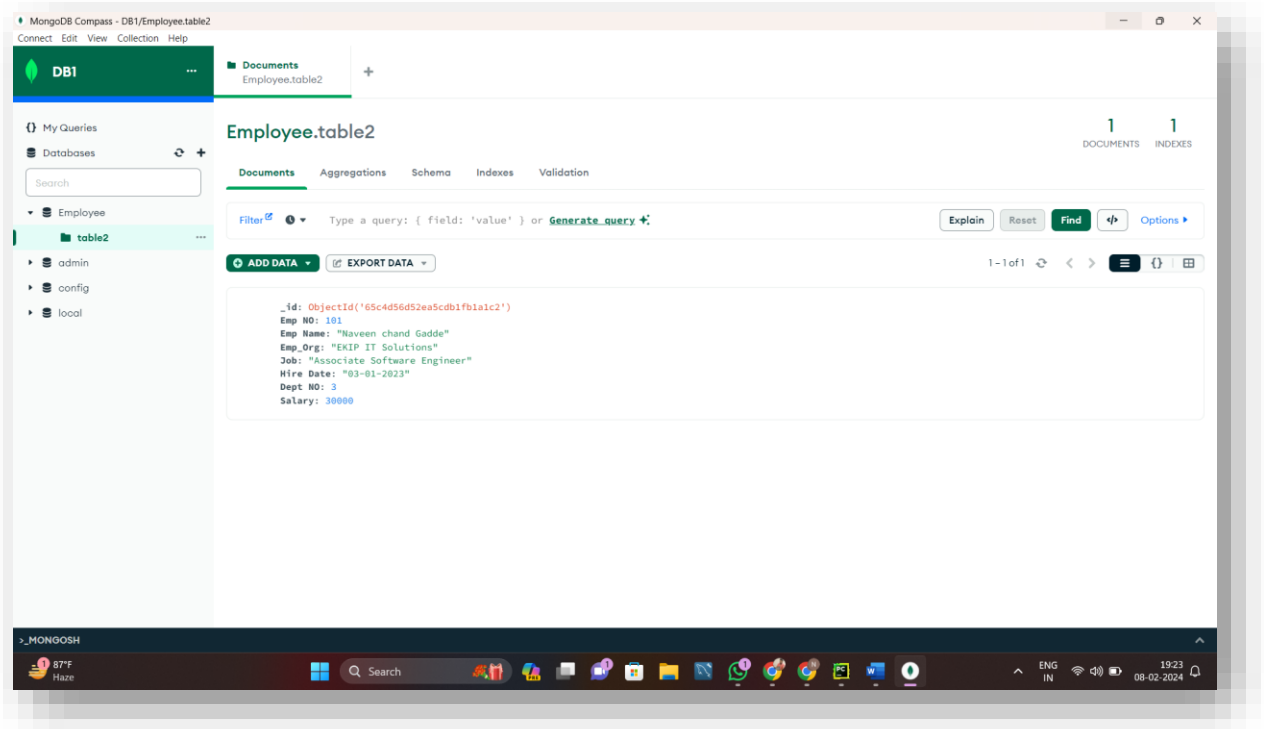

New folder > MongoDB.py

```

3.2 Employee and Organization Classes

Instances of the Employees and Organization classes are created using the provided information. The attributes of these instances are set based on user input.

3.3 Output

The system outputs the entered details, including employee and organization names, to the console. Additionally, a confirmation message indicates that the information has been successfully pushed to MongoDB.

Conclusion

This script allows for the collection of employee information such as employee number, name, organization, job role, hiring date, department number, and salary. The collected information is then stored in a MongoDB database for further retrieval and analysis.

Note

Ensure that the MongoDB server is running and accessible at "localhost:27017" before executing the script.
